PART 1

Questions 1–6

Read the text. Fill in each gap with ONE word. You must use a word which is somewhere in the rest of the text.

THE LONDON UNDERGROUND

Here in Britain, we have been celebrating a birthday. Not the **Q1** _____ of a person, however, but the birthday of a railway. One hundred and fifty years ago, in January 1863, the first underground railway in the world carried its first passengers. It ran for 6 kilometres from Paddington in London to a place close to the City, which is the name we call London's main business district.

The new **Q2**_____ was controversial and unpopular with many people. The men building the railway dug up the streets and knocked down houses and other buildings. They **Q3** _____ a deep trench and put the railway track at the bottom. Then they covered over the new railway and remade the surface of the street. Not surprisingly, the construction work caused chaos in London for many months.

More underground railway lines opened in the following years. The railway companies found new ways to build and operate them. Instead of digging huge **Q4**_____s in the streets, they bored holes deep under the city. People called these underground lines "tubes" because the tunnels had a circular shape like tubes. Nowadays, we say "the Tube" to mean all of the London underground system. It was of course impossible to use steam engines on the **Q5**_____ Tube lines; they had electric trains instead. By the beginning of the 20th century, electricity had replaced steam on all the underground lines.

To finish this podcast, here is some Underground vocabulary for you to learn.

When you go into an Underground station, you will see signs that say things like "Bakerloo Line southbound". "Southbound" means "traveling south" – and "northbound" means traveling north, and I am sure you can work out what "eastbound" and "westbound" mean.

After you have followed the signs and found the right platform, and the train has arrived, you will often hear an announcement telling passengers to "mind the gap". To "mind" something means to be careful – the **Q6**_____ means "be careful. There is a gap between the edge of the platform and the doors of the train. Take care not to fall down."

PART 2

Questions 7–14

The teenagers below all want to work as volunteers to help the environment. There are descriptions of clubs which help the environment. Decide which club would be the most suitable for the people below.

7

Q7 – Ali

Ali lives in the country and wants to help wildlife in his area. He has experience caring for animals and would like to share this knowledge with other young people.

8

Q8 – Sam

Sam lives in a harbour town and is worried about the amount of pollution in his area. He wants to know what effect this is having on the local wildlife and he would also like to take part in events to help reduce pollution where he lives.

9

Q9 – Hannah

Hannah only has free time at the weekend to meet other teenagers interested in making things out of materials that are recycled. She wants to help organise a social event to make more people in her town start reducing the amount of rubbish they throw away.

10

Q10 – Fatema

Fatema has brilliant computer skills and would love to join a club that meets online. She wants to share information to let people know which animals are in danger and ways to help them.

11

Q11 – Joe

Joe lives in a city and wants to meet other people who are interested in the environment. He wants to know how pollution affects plants and learn how to grow food in a city garden project.

12

Q12 – Billy

Billy would like a job where he can be active outside. He wants to earn as much money as possible so that he can buy a new bike. He's happy to work hard.

13

Q13 – Yasmin

Yasmin is crazy about anything related to food. She hopes to work during the week as she wants to spend Sundays with her family. She's shy and doesn't want to work with customers.

14

Q14 – Zoe and Bea

Zoe and Bea don't want to cycle very far and they can't start early in the morning. They're interested in art and would like to have lunch somewhere near the sea.

A) Safe Zone – We provide a safe place for wildlife such as bats, snakes and rabbits that have been injured. Our teams of experts care for them until they're healthy enough to go back into nature. Our team wants to train more young people to help us with jobs like cleaning the cages and preparing the animals' food.

B) Earth's Friends – We get creative at Earth's Friends! This youth club is for teens who want to get involved with online projects such as making more people aware of pollution in cities and how it is affecting the climate. Our website has a fantastic travel planner, so you can see how walking or cycling reduces pollution in your local area.

C) Eco-Teen – Come and help clean up rubbish in our city parks! It's not easy, but you'll make loads of new friends who share the same passion as you do. And it's not all hard work – we have summer barbecues, guest speakers and group discussions about how we can help to protect animals in the area.

D) Green Time – Come and learn about all the different species that live in our local fields, woods and back gardens. And if you've got any experience looking after animals, let us know! We're short on youth volunteers who can offer tips and advice at our weekly teen meetings in villages and towns across the nation. Our club wants to provide a softer environment for local creatures – big and small – by holding talks and events.

E) Listen Up! – You can access our weekly meetings from any time zone on our award-winning website, where you can chat with young people concerned about the environment. Our members are passionate about making people aware of the things everyone should do to save and protect species all over the Earth. Members post updates and articles about wildlife issues weekly.

F) Genius! – Don't put your bottles, newspapers and tin cans in the recycling bin – bring them to any Saturday-morning meeting, when our expert environmental artist shows you how to make art out of rubbish! Take part in planning the annual event to show off your creative projects to the public, and share tips on ways to reduce waste.

G) Nature First – Come and get some fresh air and meet people of all ages concerned about the environment at our beach project, where we collect plastic to be recycled in a coastal area near you. Learn how waste in our oceans harms sea life and what you can do about it.

H) Band Together – You won't believe you're in the middle of the city where our club meets every Sunday afternoon. Come and see all of the different crops we produce at our little farm. Young and old are invited to come and find out when to pick what you've planted when you join Band Together. We also discuss monthly topics such as vehicles and how they affect nature.

I) Care home assistant – A young person is wanted to work at our care home for four hours on Saturday and Sunday afternoons. The job requires you to make tea and fetch snacks for our elderly residents, as well as sit and chat to them. All our assistants must have basic kitchen skills.

J) Farm assistant – The position of farm assistant is available over the summer period. The job involves picking fruit for several hours per day and assisting with the packing of the fruit before it is sent for delivery. You must be fit and happy to work outdoors for long periods of time. No previous experience needed. We offer a good salary.

K) Kitchen assistant – We need a part-time assistant to work in the small kitchen or our hotel restaurant. The job involves preparing food before the restaurant opens and then cleaning the dishes after we have served the food. We require someone to work three hours Tuesday to Saturday, and Friday and Saturday evenings. We offer good pay.

L) Seaview Gallery – Less than an hour's ride along the coast road, shows paintings and photographs by local artists in attractive rooms on the cliffs. Open 2pm–5pm. There's a teashop next door which serves delicious lunches and teas.

M) An excellent destination for families is Ailsham, where there is a campsite. The route includes only one tiny hill and the views of woods and farmland are lovely. Stop for a picnic under the trees. When you arrive, enjoy a swim in the river, then spend a night in one of the tents provided.

PART 3

Questions 15–20

Read the text and choose the correct heading for each paragraph from the list of headings below. There are more headings than paragraphs, so you will not use all of them. You cannot use any heading more than once.

List of Headings:

A) Instruction on how to recognise authentic Maori hooks from counterfeit ones
B) A description of a different type of hooks that are not used to catch fish
C) An acknowledgement that Maori design and craftsmanship are still relevant in the modern world
D) An investigation into how the hooks functioned so effectively
E) A description of how modern technology began to dominate and eventually took over from traditional hook construction
F) A list of raw materials used to construct hooks
G) An outline of how different styles of hooks and types of materials were employed to catch larger fish
H) An account of how the Maori employed new technology and adapted it

15. Paragraph 1 **16. Paragraph 2** **17. Paragraph 3**
18. Paragraph 4 **19. Paragraph 5** **20. Paragraph 6**

MAORI FISH HOOKS

1. When Polynesians first came to New Zealand sometime within the years 1100–1300 AD, they didn't have the technology necessary to heat and manipulate metal out of rocks. Meanwhile, fish was the settlers' main food source at the time, so fishermen made their hooks and fishing gear out of wood, bone, stone and shells. Other plants native to the island of New Zealand, like flax (harakeke), cabbage tree (ti) and astelia (kiekie) gave the necessary fibrous material to make fishing lines and nets of greater or equal strength to the jute, which was being used by the Europeans at the time. However, as a material, metal is more malleable, and can be changed into any shape, while natural materials are limited in the shapes they can take on. The Maori fish hooks needed to be more innovative in the ways that they dealt with these limitations.

2. The Museum of New Zealand Te Papa Tongarewa did their own recent study on Maori fish hooks two hundred and thirty years later, and were able to demonstrate that the unique hook design was a matter of function. The hook's design allowed it to catch fish by spinning away from the direction of the point and catching their jaws, instead of poking a hole through the fish or by being used as a lever, which some archaeologists also suggested. It seems that the design of the Maori fish hook is, perhaps, the world's most efficiently and masterfully designed fish hook, likely superior to any modern metal fish hook of today.

3. To make larger hooks, Maori used shanks made of strong wood, with stout points made of bone or shell. They tied tree branches and saplings together to grow them into the ideal shapes for building, then harvested the plants when they grew to the appropriate size. They hardened wood by carefully drying it and burying underground with fires lit above it. Human bone was often used for bone points, which they lashed securely to a groove at the end of the shank with pre-made flax materials (muka). When they wanted to catch larger species like sharks, groper and ling, they used composite hook. However, average the traditional hook was usually not longer than a three finger breadth (128 mm length).

4. Maori adopted new materials quickly once they became available with European explorers, sealers and whalers who began to arrive towards the end of the 1700s. At this point, the Maori were still making their fish hooks, but now using metals and imported materials. Wooden and flax parts of old, abandoned fish hooks decomposed quickly as traditional hooks were cast away in favor of new ones. Tools made of luxury materials such as ivory or greenstone may have been kept around as decorations items, with stylized Maori fish hooks seen today as a symbol of cultural revitalization.

5. The Maori kept recreating traditional designs even as new materials poured in, preferring hook shapes which were introduced by Pakeha into the 1800s. By following the tradition of the rotating hook design, they remained connected with a part of their traditional culture. In the end, though, it was only a matter of time before the amount of mass-produced metal European hooks finally overwhelmed the area, highlighting the difficulty of making hooks from nails, horseshoes and other metal objects, and finally the use of the traditional designs fell out of favor.

6. By the end of the 19th and beginning of the 20th century, tourists and collectors' demands for Maori artifacts had grown, leading manufacturers to produce large quantities of forged hooks. These replicas were then traded with both Maoris and Europeans to use as forgeries of the real thing, sometimes directly commissioned by artifact dealers themselves. Fake hooks can be spotted by their cheap construction, inconsistent materials, rudimentary lashings, odd or over-elaborate decorative carvings, and finally, by the lack of in-turned points or angled grooves used to actually attach the fishing line.

PART 4

Questions 21–29

Read the following text for questions 21-29.

MARKETING AND MIND CONTROL

How marketing and advertising appeal to the associative nature of the brain

While there had been a long tradition of giving rings as a commitment to marry, the custom of giving diamond engagement rings was in large part manufactured by one of the most effective marketing campaigns in history. In the early 1900s, diamond sales were declining, posing a serious problem for the company that essentially had control over the diamond market. In 1938, this company hired an advertising agency. Which proposed reshaping social attitudes toward diamonds? As well as magazines showing film stars draped in diamonds, the agency arranged for movies to incorporate diamond engagement rings into their plots. The campaign culminated with the slogan: 'A diamond is forever.' At the time, the approach was unique. Rather than pushing a brand, the objective was to promote diamonds as the symbol of everlasting love. This was achieved by exploiting the associative nature of the brain: associating neurons! Activated by the concept of 'love' with neurons that encoded the concept of "diamonds. By 1941, diamond sales had increased by 55%.

Advertising comes in many forms, from blatant neon signs to subtly embedded products in movies. In each case, the goal is to mould our habits, desires and opinions. Our visual system is targeted by an avalanche of information on the internet, street posters, and billboards and in movie theatres. Our auditory system submits to catchy radio jingles and telemarketers. More surreptitiously, our olfactory system is targeted by variations of vanilla and citrus perfumes aimed at enticing US to linger in a retail outlet. It is difficult to measure how effective these campaigns are, but as in the 'A diamond is forever' campaign, they can be so successful that they change the fabric of our culture. In the case of bottled water, we are swayed by advertising into paying for something that we can obtain for free. Most people cannot distinguish bottled from tap water, which is why you rarely hear of a bottled water company proposing a blind taste test.

So why is marketing such an effective mind-control technique? It is interesting to consider whether other animals exhibit anything analogous to humans' susceptibility to advertising. If we provide a lab rat with two types of cereal, it will consume approximately the same amount of each. However, if we put that rat with another rat that spent its day eating just one type, when faced with a choice, our rat will now show a preference for the same type as the other rat was eating. Psychologists call this 'socially transmitted food preference'.

What many regard as the first documented examples of cultural learning in primates started with a clever monkey that lived in a colony of Japanese monkeys on the island of Koshima. She began taking her dirt-covered sweet potatoes to the river to wash them before eating them. Upon seeing this, a few 11 other open-minded monkeys picked up on the idea. Potato washing then spread from monkey to monkey and, over the course of a few years, most monkeys were eating clean potatoes. Humans are clearly not the only animals to engage in imitation and social learning.

Learning by observation can be an extraordinarily valuable brain feature, this is how we learn to communicate and perform motor skills as well as deal with many everyday problems. For example, a newcomer struggling to purchase tickets and navigate the subway system in a foreign city may step back to learn from the people nearby. Humans and other primates exhibit multiple forms of imitative learning and this is called cultural transmission.

A component of advertising relies on the marketer's ability to tap into the brain's propensity for imitation. Anybody who has watched TV knows advertisements are disproportionately populated with attractive, successful looking individuals. If we are going to imitate someone, we are more inclined to imitate those who appear to be popular and appealing.

Although not all researchers are convinced by the findings, a number of studies indicate that some animals also imitate dominant members of their group. Primatologist Frans de Waal provides anecdotal evidence of preferential imitation among chimpanzees. He noted that in one particular group the dominant male was hurt and was limping as a result. Soon unlikely if a non-dominant male had been injured.

Imitation is undoubtedly an invaluable ability, but often our propensity to imitate generalises indiscriminately, leading to poor decisions. When athlete Dick Fosbury revolutionised the high jump by jumping over the bar backward in 1968, imitators obviously copied his jumping style, not his brand of sports shoes. However, today, sports people appear in advertisements asking US to buy the laptops or sports drinks that they promote. Rationally, we know these people's success did not depend on these products, so it seems our propensity to purchase products relates more to neural programs that evolved to encourage imitation of those further up the social ladder. Today, companies engage in stealth marketing campaigns in which people are paid to frequent bars or websites to covertly promote certain products. Companies also perform studies in which they track the eye movements of people viewing displays, and carefully craft names, packages and jingles associated with their products. While we may like to believe that manipulation on a grand scale would not be possible, that's not to say that advertising is innately harmful. To the contrary, the marketing of products or ideas is essential to human culture. The point is that we should ensure our choices reflect our actual goals and desires, and we must distinguish between the dissemination of information which is for our own good, and our manipulation for the benefit of companies.

Choose the correct letter A, B, C or D.

21 According to the writer, which marketing technique attempts to make consumers stay in a shop for longer?

A) playing appealing music
B) emitting pleasant scents
C) displaying attractive posters
D) making in-store announcements

22 The writer mentions bottled water in order to show that

A) consumers buy it because of the fact that it is marketed.
B) people purchase it despite the fact that it has no taste.
C) marketers need not do taste tests when a campaign is effective.
D) tests prove that people cannot differentiate it from tap water.

23 According to the writer, socially transmitted food preference occurs when

A) only dominant members of an animal group influence what others eat.
B) the same types of animals naturally prefer the same types of food.
C) animals are influenced by what any other animals of the same species eat.
D) a food type is more desirable because an animal views that food as scarce.

24 According to the writer, how is learning by observation and imitation a useful feature of the brain?

A) it helps people overcome challenges.
B) positive models can influence social behaviour.
C) it can give an advantage when communicating with others.
D) cultural norms and relationships can be understood more easily.

25 **According to the writer, how does television advertising exploit the human tendency to imitate others?**

A) It shows buying behaviour that marketers want to encourage in viewers.
B) It features people who have a desirable image.
C) It shows older people whom teenagers admire.
D) It features successful people endorsing products responsible for their success.

Do the following statements agree with the views of the writer in the Reading Passage?

26 **The diamond campaign worked by making a connection in people's minds between diamonds and luxury.**

A) True
B) False
C) Not Given

27 **People are more aware of visual marketing than auditory marketing.**

A) True
B) False
C) Not Given

28 **The campaign advertising diamonds had a positive influence on society.**

A) True
B) False
C) Not Given

29 **There is still some uncertainty about whether animals copy the behaviour of the most powerful animals among them.**

A) True
B) False
C) Not Given

PART 5

Questions 30–35

Read the following text for questions 30-35.

HOW THE MIND AGES

The way mental function changes is largely determined by three factors – mental lifestyle, the impact of chronic disease and flexibility of the mind.

Experiments have shown that younger monkeys consistently outperform their older colleagues on memory tests. Formerly, psychologists concluded that memory and other mental functions in humans deteriorate over time because of changes in the brain. Thus mental decline after young adulthood appeared inevitable. The truth, however, is not quite so simple.

Stanley Rapoport at the National Institute of Health in the United States measured the flow of blood in the brains of old and young people as they completed different tasks. Since blood flow reflects neural activity, Rapoport could compare which networks of neurons were the same, the neural networks they used were significantly different. The older subjects used different internal strategies to accomplish comparable results at the same time, 'Rapoport says. At the Georgia Institute of Technology, psychologist Timothy Salthouse compared a group of fast and accurate typists of college age with another group in their 60s. Both groups typed 60 words a minute. The older typists, it turned out, achieved their speed with cunning little strategies that made them more efficient than their younger counterparts. They made fewer finger shifts, gaining a fraction of a second here and there. They also read ahead in the test. The neural networks involved in typing appear to have been reshaped to compensate for losses in motor skills or other age changes.

In fact, there's evidence that deterioration in mental functions can actually be reversed. Neuropsychologist Marion Diamond at the University of California has shown that mental activity maks neurons sprout new dendrites* which establish connections with other neurons. The dendrites shrink when the mind is idle. For example, 'when a rat is kept in isolation, the animal's brain shrinks, but if we put that rat with other rats in a large cage and give them an assortment of toys, we can show, after four days, significant differences in its brain,' says Diamond. 'After a month in the enriched surroundings, the whole cerebral cortex has expanded, as has its blood supply.' But even in the enriched surroundings, rats get bored unless the toys are varied. 'Animals are just like we are. They need stimulation,' says Diamond. A busy mental lifestyle keeps the human mind fit, says Warner Schaie of Penn State University. 'People who regularly participate in challenging tasks retain their intellectual abilities better than mental couch potatoes.'

In his studies, Schaie detected a decline in mental function among individuals who underwent lengthy stays in hospital for chronic illness. He postulated it might be due to the mental passivity encouraged by hospital routine.

One of the most profoundly important mental functions is memory. Memory exists in more than one form, what we call knowledge – facts – is what psychologists such as Harry Bahrick of Ohio Wesleyan University call semantic memory. Events, conversations and occurrences in time and space, on the other hand, make up episodic memory. It's true that episodic memory begins to decline when most people are in their 50s, but it's never perfect at any age.

Probing the longevity of knowledge, Bahrick tested 1,000 high school graduates to see how well they remembered the school subject algebra. Some had completed the course a month before, other 50 years earlier. Surprisingly, he found that a person's grasp of algebra did not depend on how long ago he'd taken the course. The determining factor was the duration of instruction. Those who had spent only a few months learning algebra forgot most of it within two or three years while others who had been instructed for longer remembered better. According to Bahrick, 'the long-term residue of knowledge remains stable over the decades, independent of the age of the person and the memory.'

Perhaps even more important than the ability to remember is the ability to manage memory – a mental function known as metamemory. 'You could say metamemory is a byproduct of going to school,' says psychologist Robert Kail of Purdue University. 'The question-and-answer process, especially exam taking, helps children learn and teaches them how their memory functions. This may be one reason why the better educated a person is, the more likely they are to perform well in many aspects of life and in psychological assessments: A group of adult novice chess players were compared with a group of child chess experts at the game. But when asked to remember the patterns of chess pieces arranged on a board, the children won.' Because they'd played a lot of chess, their knowledge of chess

was better organized than that of the adults, and their existing knowledge of chess served as a framework for new memory, 'explains Kail. Cognitive style, another factor in maintaining mental function, is what Schaie calls the ability to adapt and roll with life's punches. 'He measured mental flexibility with questions and tests requiring people to carry out in an offbeat way an everyday activity they had done millions of times. One example was asking people to copy a paragraph substituting uppercase letters for lowercase ones. These tests seem silly, but flexible-minded people manage to complete them,' says Schaie. 'The rigid person responds with tension instead and performs poorly. Those who score highly on tests of cognition at an advanced age are those who tested high in mental flexibility at middle age'.

On a more optimistic note, one mental resource that only improves with time is specialized knowledge. Crystallised intelligence about one's occupation apparently does not decline at all until at least age 75. Vocabulary is another such specialized form of knowledge. Research clearly shows that vocabulary develops with time. Retired teachers and journalists consistently score higher on tests of vocabulary and general information than college students.

Choose the correct letter A, B, C or D.

30 **What does the writer say about the performance of older typists on the test?**

A) They used different motor skills from younger typists.
B) They had been more efficiently trained than younger typists.
C) They used more time-saving techniques than younger typists.
D) They had better concentration skills than younger typists.

31 **The experiment with the rats showed that**

A) brain structure only changed when the rats were given a familiar toy.
B) the rats became anxious after a lengthy period of time alone.
C) the rats lived longer then they were part of a social group.
D) the rats' brains expanded or shrank depending on the level of mental activity.

Complete the summary below. Choose ONE WORD ONLY from the passage for each answer.

TYPES OF MEMORY

Psychologists distinguish between two different types of memory: **32**_____ and **33**_____ memory. A study was conducted into people's knowledge of **34** _____ to determine recall ability. This aspect of memory was found to be a function not of age but rather of length of tuition. School also helps with a brain function called **35**_____.

MOCK TEST 25

35 answers

1 birthday
2 railway
3 dug
4 trench / trenches
5 deep
6 announcement
7 D
8 G
9 F
10 E
11 H
12 J
13 K
14 L
15 F
16 D
17 G
18 H
19 E
20 A
21 B
22 A
23 C
24 D
25 B
26 False / B
27 Not Given / C
28 Not Given / C
29 True / A
30 C
31 D
32 Semantic
33 Episodic
34 Algebra
35 Metamemory
