PART 1

Questions 1–6

Read the text. Fill in each gap with ONE word. You must use a word which is somewhere in the rest of the text.

WATER HYACINTH

The water hyacinth grows in tropical countries. It has beautiful purple-blue flowers, but everybody hates it. Why?

Millions and millions of these plants **Q1**_____ in rivers and lakes. Sometimes the plants become so thick that people can walk on them. People cannot travel in boats on the water, and they cannot fish in it. The **Q2**_____ stop the water from moving. Then the water carries diseases. Farmers cannot use the water on their land.

Now scientists think that **Q3**_____ hyacinths can be useful. The plants are really a tree crop. No one has to take care of them. They just grow and grow and grow. What can **Q4**_____ use them for?

Some fish like to eat them. Farmers can grow these fish in the lakes and rivers. Workers can collect and cut the plants with machines. Then they can make fertilizer to make their crops grow better. They can also make feed for their farm animals. Maybe it will be possible to make methane gas for energy. (We burn gas from petroleum for energy. **Q5**_____ gas comes from plants.)

Then poor tropical countries will not have to buy so much expensive **Q6**_____. Maybe in the future people will love the water hyacinth instead of hating it.

PART 2

Questions 7–14

The people below all want to visit a museum. There are descriptions of museums. Decide which museum would be the most suitable for the following people.

7

Q7

Jake and Maureen have different interests but want to go somewhere they will both enjoy. Jake loves anything to do with the sea, while Maureen's interested in social history and the lives of women.

8

Q8

Melanie is a history teacher. She wants to take her class to a museum where they will be allowed to touch things and have activities to do during their visit.

9

Q9

Roger is keen to find out about different forms of transport in towns over the last hundred years. He would like to attend a talk while he is at the museum.

10

Q10

Kazuko studies English literature and thinks that seeing where writers lived will help her understand their books better. She finds it useful to look at pictures which are connected with the books.

11

Q11

Nick is more interested in learning about the countryside than learning about people from the past. He needs information for some schoolwork he is doing about what happens to rivers and hills over time.

12

Q12

Ingrid's eldest daughter is learning about English history and would like to go somewhere to bring this subject to life. Ingrid is really interested in flowers.

13

Q13

Trevor is an artist and enjoys drawing wildlife. He recently visited a zoo and drew large animals and would like to try sketching something smaller.

14

Q14

Sarah and her husband would like to spend the day outdoors. They don't like going on rides but are both interested in history and how people used to live.

A) Red House — Travel back to the time of the novelist Charlotte Brontë and find out about her friends and local connections. Discover the comforts and discomforts of the 1830s country home where Charlotte sometimes stayed as a guest of Joshua Taylor's family and got ideas for her novel Shirley.

B) Castle Museum — The castle was built looking down on the valley of the River Dean. It is now a museum, where you can learn how the valley has changed over millions of years. There is a collection of interesting rocks and fossils found in the area, and pictures showing how the valley probably looked in prehistoric times.

C) Hillcrest Museum — Enjoy an experience of digging up the past. Handle pieces of ancient pots, tools and other objects from many countries. Learn to date them and see what they tell us about how people lived then. Also try out computer programs which help plan the digging-up of sites. School groups should book in advance.

D) Shandy Hall — Here in the 1760s, Laurence Sterne wrote Tristram Shandy. His fifteenth-century house is now surrounded by a large garden full of beautiful and unusual plants. Inside there is an important collection of Sterne's novels plus the original drawings which were included in his works.

E) Museum of Peace — Situated in beautiful countryside, this is the only museum of its kind in the country. It has a growing collection of art and objects connected with peace history, non-violence and the ending of war. It also has material which can be used after the visit back in the classroom.

F) Fishing Centre — Study the routes used by fishermen over the last two hundred years and see how their ocean-going boats worked. A new exhibition explores the position of wives and mothers in the old fishing towns, giving information about their occupations, and their attitudes to work and home.

G) Viking Centre — Come and experience what life was like 1,200 years ago in this Viking town, rebuilt at the mouth of the river. Our introductory talk will inform you about the close relationship the Vikings had with the sea — they were excellent fishermen, sailors and boat-builders. There are also tools, clothes and everyday items to look at.

H) Horsepower Museum — This museum reminds us just how important horses were to life in the nineteenth and early twentieth centuries. It has a permanent exhibition of old trams and buses, which used to be pulled through the streets by horses. The staff here are very knowledgeable and give daily lectures on this fascinating collection.

I) Warwick Castle — Regarded by many as Britain's greatest Medieval Castle. Visit exhibitions, climb the castle towers, relax as you walk around the gardens, designed and created in 1753 by Capability Brown. Experience the preparations for battle in the Kingmaker exhibition or witness a Victorian Royal Weekend. And if your interest is more in the darker side of the Castle's history visit The Castle Dungeon.

J) Stratford Butterfly Farm — The biggest butterfly farm in Europe. Whatever the weather come and see these beautiful creatures as they would live in their natural environment. Walk around a tropical rainforest as butterflies fly freely around you. See them as they come into the world in the Caterpillar Room. And don't miss Insect City where you can view huge spiders and our very own scorpion colony!

K) Black Country Museum — It's been called Britain's friendliest open-air museum. Come to Black Country Museum and discover an old-fashioned village by the canal. Look around original old-fashioned shops and houses, see what it's like down a mine and take a ride on a tramcar.

L) Drayton Manor — One of the UK's most popular attractions. The park is home to some of the scariest rides you'll find like Stormforce 10 and Apocalypse, which has been voted the UK's most frightening ride. You'll also find an indoor and outdoor play area and of course, Drayton Manor Zoo with over one hundred different species, including twelve rare breeds from across the world.

PART 3

Questions 15–20

Read the text and choose the correct heading for each paragraph from the list of headings below. There are more headings than paragraphs, so you will not use all of them. You cannot use any heading more than once.

List of Headings:

A) Guard your time
B) Make a difference
C) Why it's so hard
D) Set a date
E) Get creative
F) Meet likeminded people
G) Change your life
H) Establish your goals
I) Do what you want
J) Plan ahead

15. Paragraph 1 **16. Paragraph 2** **17. Paragraph 3**
18. Paragraph 4 **19. Paragraph 5** **20. Paragraph 6**

MAKE MOST OF YOUR FREE TIME

1. Studies say that people nowadays have more free time than ever before. Then why doesn't it feel that way? These days, our free time is usually spent watching television, using computers or communicating on our phones. Images and information are constantly flashing into our brains, so it's no wonder we don't feel as if we have really switched off. To really wind down and help us regain our energy levels, it is important to use our free time wisely.

2. Don't let anything else encroach on your free time. Ignore the washing up and the vacuuming. Don't check your inbox for messages and turn off your mobile phone. Otherwise, the lines between free time and everyday live will begin to blur, and you won't feel refreshed.

3. In many free time activities, we take the role of consumer. When we watch TV, play video games or read, we are only passively involved. Take on the role of producer for a change. Build a model, write a blog or make an animation film. You will use a different part of your brains and will feel more energised as a result.

4. But don't go overboard. Many people worry too much about their free time activities. They want to do things that will impress their friends, look good on their résumés or help them get a better job. But free time isn't about that. It is about doing an activity for enjoyment's sake, so don't let outside pressures influence your choice.

5. You'll really know you're using your time wisely if what you're doing helps other people. So find out what's going on in the community and lend a hand. Visit the elderly or help out in a children's club. If socialising's not your thing, why not volunteer for a wildlife organisation?

6. Once you're relaxed and energised, you can think about what you'd like to improve in your life. Want to get fit? Learn a skill? Improve your job prospects? There are plenty of groups, clubs and classes you can join that will set you on a completely new life path. So what are you waiting for? Get out there and enjoy yourself!

PART 4 Questions 21–29

Read the following text for questions 21-29.

EL NINO AND SEABIRDS

A. Rhythm of the seasons cannot always be relied upon. At times the tropical Pacific Ocean and large expanses of the global atmosphere seem to be marching to the beat of a different drummer, disrupting the normal patterns of countless species of plants and animals along with hundreds of millions of human beings. So they want anticipate these occasional lapses in the march of the seasons and help societies plan accordingly, scientists are seeking to understand these competing rhythms: the strongest of which is the alternation between the "normal climate" and a different but still recurrent set of climatic conditions in the Pacific region called El Nino.

B. Seabirds are prominent and highly visible components of marine ecosystems that will be affected by global climate change. The Bering Sea region is particularly important to seabirds; populations there are larger and more diverse than in any similar region in North America—over 90% of seabirds breeding in the continental United States are found in this region. Seabirds, so named because they spend at least 80% of their lives at sea, are dependent upon marine resources for food. As prey availability changes in response to climatically driven factors such as surface sea temperature and extent of sea ice, so will populations of seabirds be affected.

C. Seabirds are valued as indicators of healthy marine ecosystems and provide a "vicarious use value" or existence value—people appreciate and value seabirds simply because they are there and enjoy them through venues such as pictures, nature programs, and written accounts without ever directly observing seabirds in their native environment. A direct measure of this value is demonstrated by Federal legislation that established specific national wildlife refuges to protect seabirds and international treaty obligations that provide additional protection for seabirds. Seabirds are also an important subsistence resource for many who live within the Bering Sea Region. Furthermore, the rich knowledge base about seabirds makes them a valuable resource as indicator species for measurement of change in the marine environment.

D. The most abundant breeding species in Alaska are northern fulmars, storm-petrels, kittiwakes, murres, auklets and puffins. These species also form the largest colonies. Fulmars, storm-petrels and kittiwakes are surface feeders, picking their prey from the surface or just below the surface; murres, auklets, and puffins dive for their food. Fulmars nest primarily on island groups in and around the Bering Sea. They take a wide variety of prey (e.g., fish, squid, zooplankton, jellyfish) from the surface or just below the surface. Storm-petrels are strictly nocturnal and nest below ground in either burrows or crevices between rocks. They forage on zooplankton and squid; in some areas they are dependent upon small fish such as capelin and sand lance caught at the surface. Black-legged kittiwakes are widespread throughout Alaska, Canada and Eurasia while red-legged kittiwakes are found only in the Bering Sea region. Both are surface feeders although black-legged kittiwakes feed primarily on small fish and forage over the continental shelf and shelf break; red-legged kittiwakes feed primarily on myctophids and will forage beyond the shelf break.

E. Marine mammals have exhibited similar signs of food stress in recent years. Harbor seals at Tugidak Island in the Gulf of Alaska declined by about 85% between 1976 and 1988. Steller sea lion populations declined by 36% in the Gulf of Alaska between 1977 and 1985, and by another 59% between 1985 and. Northern fur seals declined about 35% by 1986 from their average numbers in the 1970s, although numbers had rebounded somewhat (20%) by 1990. Associated with the declines in Steller sea lions are declines in birth rate, fewer breeding females, fewer pups, decreased adult body condition, decreased juvenile survival, and a change in population age structure.

F. Walker noticed that monsoon seasons with low-index conditions are often marked by drought in Australia, Indonesia, India, and parts of Africa. He also claimed that low-index winters tend to be unusually mild in western Canada. One of his British colleagues chided him in print for suggesting that climatic conditions over such widely separated regions of the globe could be linked. In his reply Walker predicted, correctly, that an explanation would be forthcoming, but that it would require a knowledge of wind patterns above ground level, which were not routinely being observed at that time.

G. The need for long-term time series It seems obvious that without good baseline data ornithologists are doomed to be surprised by the arrival of El Nino every few years. Even when ornithologists and ecologists are at hand to take advantage of an incoming El Nino, lack of preexisting data, and of monitoring afterwards, makes it difficult 134 F.M. Jaksic & J.M. Farina to understand responses of birds to the successive El Nino, La Nina, and "normal" years. Indeed, according to Jaksic, during the last century there were 12 El Nino years and 12 La Nina years, thus leaving about 76 'normal' years in between. Thus, by heavily concentrating attention on only 12% of the time span El Nino, and of neglecting possibly another 12%, ornithologists are essentially ignoring what happens during 76% of the time. This situation may be remedied only as long as data are logged on a regular or continuous basis, that is, as long-term time series. The recipe prescribed by Schreiber & Schreiber to understand El Nino, effects on birds still stands: "...carry out long-term studies that will shed further light on the interactions between global atmospheric cycles, oceanographic phenomena, and avian populations."

H. Populations of seabirds in Alaska are larger and more diverse than any similar region in the Northern Hemisphere. The extensive coastal estuaries and offshore waters of Alaska provide breeding, feeding and migrating habitats for 66 species of seabirds. At least 38 species of seabirds, over 50 million individuals, breed in Alaska. Eight Alaskan species breed only here and in adjacent Siberia. Five additional species range through the North Pacific, but their populations are concentrated in Alaska. In addition to breeding grounds, Alaskan waters also provide important wintering habitat for birds that breed in Canada and Eurasia. Shearwaters, which breed in the southern hemisphere, are the most numerous species in Alaskan waters during the summer.

I. As another indication that food has been limiting in recent years, several largescale die-offs of seabirds, mostly surface-feeding species, have been observed in the Gulf of Alaska during the last decade, most notably in 1983, 1989, and 1993. But Hatch thinks that it is too early to decide the these die-offs reports are somehow connected with the effect of El Nino. Byrd and Tobish believe that high rainfall can affect survival of chicks in earthen burrows, and incidence of big storms with high winds during the chick-rearing period can cause mortality for chicks of species nesting on cliff-ledges, but this view has not been considered as convincing evidence.

Choose the correct letter A, B, C or D.

21 **Why do scientists want to investigate El Nino phenomenon at beginning of the paragraph?**

A) To learn patterns of creatures that live in marine environment.
B) Assist us to map out because it disturbs normal cycle of for wildlife and human.
C) It has profound theory for both the academic side and practical side.
D) Tropical Pacific Ocean is where El Nino affects most.

22 **Why do scientists use seabirds as important subjects when observe climate change world-widely?**

A) Seabirds affected by prey changes according to the temperature and ice.
B) Its size is large enough to be observed.
C) El Nino affects seabirds more than other sea creatures.
D) North America is situated in the area where El Nino affects most.

23 **What happened for Marine mammals that live in Tugidak Island in Gulf of Alaska?**

A) Number of seals declined about 85% from the mid of 20th century.
B) Number of Steller sea lion declined while Number seals grew.
C) Birth rate and breeding females declined on the Tugidak Island.
D) The situation of mammals on the island is not that worse than we expected.

24 **According to J. Walker, what happens in the monsoon seasons notably?**

A) Flood and drought seriously damage almost everywhere of the planet.
B) Walker's prediction would soon come true.
C) Drought only affects some parts of Africa.
D) Drought will affect somewhere of the earth such as Australia and Indonesia.

Do the following statements agree with the claims of the writer in Reading Passage?

25 **Seabirds are regarded as precious indicators of changes in oceanic environment.**

A) True
B) False
C) Not Given

26 **Seabirds such as Fulmars and Murres feed by the characteristic of prey in different ways.**

A) True
B) False
C) Not Given

27 **Steller sea lions only decline in birth rate and fewer pups, but the whole population wouldn't be affected by the changes.**

A) True
B) False
C) Not Given

28 **With reply of Walker's colleague, knowledge of wind patterns will be very helpful.**

A) True
B) False
C) Not Given

29 **It is difficult to investigate El Nino for ornithologists and ecologist because lack of available statistics and inspections.**

A) True
B) False
C) Not Given

PART 5 Questions 30–35

Read the following text for questions 30-35.

ENSURING OUR FUTURE FOOD SUPPLY

Climate change and new diseases threaten the limited varieties of seeds we depend on for food. Luckily, we still have many of the seeds used in the past–but we must take steps to save them.

Six miles outside the town of Decorah, Iowa in the USA, an 890-acre stretch of rolling fields and woods called Heritage Farm is letting its crops go to seed. Everything about Heritage Farm is in stark contrast to the surrounding acres of intensively farmed fields of corn and soybean that are typical of modern agriculture. Heritage Farm is devoted to collecting rather than growing seeds. It is home to the Seed Savers Exchange, one of the largest non government-owned seed banks in the United States.

In 1975 Diane Ott Whealy was given the seedlings of two plant varieties that her great grandfather had brought to America from Bavaria in 1870: Grandpa Ott's morning glory and his German Pink tomato. Wanting to preserve similar traditional varieties, known as heirloom plants, Diane and her husband, Kent, decided to establish a place where the seeds of the past could be kept and traded. The exchange now has more than 13,000 members, and the many thousands of heirloom varieties they have donated are kept in its walk-in coolers, freezers, and root cellars the seeds of many thousands of heirloom varieties and, as you walk around an old red barn that is covered in Grandpa Ott's beautiful morning glory blossoms, you come across the different vegetables, herbs, and flowers they have planted there.

"Each year our members list their seeds in this," Diane Ott Whealy says, handing over a copy of the Seed Savers Exchange 2010 Yearbook. It is as thick as a big-city telephone directory, with page after page of exotic beans, garlic, potatoes, peppers, apples, pears, and plums– each with its own name and personal history. For example, there's an Estonian Yellow Cherry tomato, which was brought to the seed bank by "an elderly Russian lady" who lived in Tallinn, and a Persian Star garlic from "a bazaar in Samarkand." There's also a bean donated by archaeologists searching for pygmy elephant fossils in New Mexico.

Heirloom vegetables have become fashionable in the United States and Europe over the past decade, prized by a food movement that emphasizes eating locally and preserving the flavor and uniqueness of heirloom varieties. Found mostly in farmers' markets and boutique groceries, heirloom varieties have been squeezed out of supermarkets in favor of modern single-variety fruits and vegetables bred to ship well and have a uniform appearance, not to enhance flavor. But the movement to preserve heirloom varieties goes way beyond the current interest in North America and Europe in tasty, locally grown food. It's also a campaign to protect the world's future food supply. Most people in the well-fed world give little thought to where their food comes from or how it's grown. They wander through well-stocked supermarkets without realizing that there may be problem ahead. We've been hearing for some time about the loss of flora and fauna in our rainforests. Very little, by contrast, is being said or done about the parallel decline in the diversity of the foods we eat.

Food variety extinction is happening all over the world – and it's happening fast. In the United States an estimated 90 percent of historic fruit and vegetable varieties are no longer grown. Of the 7,000 different apple varieties that were grown in the 1800s, fewer than a hundred remain. In the Philippines thousands of varieties of rice once thrived; now only about a hundred are grown there. In China 90 percent of the wheat varieties cultivated just a hundred years ago have disappeared. Experts estimate that in total we have lost more than 50 percent of the world's food varieties over the past century.

Why is this a problem? Because if disease or future climate change affects one of the handful of plants we've come to depend on to feed our growing planet, we might desperately need one of those varieties we've let become extinct. The loss of the world's cereal diversity is a particular cause for concern. A fungus called Ug99, which was first identified in Uganda in 1999, is spreading across the world's wheat crops. From Uganda it moved to Kenya, Ethiopia, Sudan, and Yemen. By 2007 it had jumped the Persian Gulf into Iran. Scientists predict that the fungus will soon make its way into India and Pakistan, then spread to Russia and China, and eventually the USA. Roughly 90 percent of the world's wheat has no defense against this particular fungus. If it reached the USA, an estimated one billion dollars' worth of crops would be at risk. Scientists believe that in Asia and Africa alone, the portion currently in danger could leave one billion people without their primary food source. A famine with significant humanitarian consequences could follow, according to Rick Ward of Cornell University.

The population of the world is expected to reach nine billion by 2045. Some experts say we'll need to double our food production to keep up with this growth. Given the added challenge of climate change and disease, it is becoming ever more urgent to find ways to increase food yield. The world has become increasingly dependent upon a technology-driven, one-size-fits-all approach to food supply. Yet the best hope for securing our food's future may depend on our ability to preserve the locally cultivated foods of the past.

Complete the notes below. Choose ONE WORD AND/OR A NUMBER from the passage for each answer.

THE FOOD WE GROW AND EAT

Supermarkets

• sell fruit and vegetables that transport well

• want fruit and vegetables to be standard in their **30** _____

Public awareness

• while people know about plants disappearing from **31** _____ very few know about the decline in fruit and vegetable varieties

Extinction of food varieties

• less than 100 of the types of **32** _____ once available in the USA are still grown

• over **33** _____ of food varieties around the world have disappeared in the last 100 years

Current problems in food production

• a particular fungus is attacking wheat in various countries

• Rick Ward believes the threat to food supplies in Asia and Africa might lead to a **34** _____

Food production in the future

• climate change and disease may put pressure on food production

• twice the amount of food may be needed because of an increase in **35** _____

MOCK TEST 29

35 answers

1	Grow	**13**	J	**25**	True / A
2	Plants	**14**	K	**26**	True / A
3	Water	**15**	C	**27**	False / B
4	Farmers	**16**	A	**28**	False / B
5	Methane	**17**	E	**29**	True / A
6	Petroleum	**18**	I	**30**	Appearance
7	F	**19**	B	**31**	Rainforests / Rainforest
8	C	**20**	G		
9	H	**21**	B	**32**	Apples
10	D	**22**	A	**33**	50 percent / 50%
11	B	**23**	C	**34**	Famine
12	I	**24**	D	**35**	Population
