5 parts · 35 questions

⏱ 60 minutes

Vaqt: 60 daqiqa. Javoblarni javoblar varaqasiga o'tkazishni unutmang.

PART 1

Questions 1–6

Read the text. Fill in each gap with ONE word. You must use a word which is somewhere in the rest of the text.

A DAY ON THE FARM

Anna and her brother Lou visited a farm. They were thrilled because they had never seen farm animals up close before. The first **Q1**_____ they encountered were sheep. Lou was surprised to learn that the wool from these **Q2**_____ is used to make clothes such as sweaters and scarves.

Next, they went to the chicken coop. Anna noticed a **Q3**_____ sitting on a nest of eggs. The farmer explained that the **Q4**_____ would hatch in about three weeks. Lou curiously asked if the chicks would resemble their father or mother. The **Q5**_____ laughed and said they might look like both.

Then, they headed to the barn, where they met a friendly cow. Anna was amazed to learn that this **Q6**_____ could produce up to 30 liters of milk. Before leaving, the children bought some milk and eggs and then returned home, happy with their visit.

PART 2

Questions 7–14

Read the texts 7-14 and statements A-J. Decide which situation described in the statements matches with the given texts. Each statement can be used ONCE only. There are TWO extra statements which you do not need to use.

7

A wedding planner takes care of all the details for a couple's big day, from finding the perfect venue to arranging flowers and catering. They work closely with the couple to create a personalized and unforgettable celebration.

8

Conference organizers plan and manage large events, such as conferences, trade shows, and seminars. They handle everything from booking venues and speakers to coordinating logistics and marketing.

9

Festival coordinators are responsible for planning and executing music festivals, food festivals, and other cultural events. They manage the lineup of performers, vendors, and activities to create a memorable experience for attendees.

10

Party planners specialize in organizing birthday parties, holiday celebrations, and other social gatherings. They take care of everything from decorations and entertainment to food and drinks, making sure the party is a success.

11

Event management companies provide a wide range of services for businesses and organizations, from planning and managing conferences to coordinating corporate events and team-building activities.

12

Charity event organizers plan and manage fundraising events for non-profit organizations. They create events that raise awareness and funds for important causes, such as cancer research or environmental protection.

13

Concert promoters are responsible for organizing and promoting live music concerts and performances. They book venues, secure artists, and handle ticket sales and marketing to ensure a successful event.

14

Sports event organizers plan and manage sporting events, from local tournaments to major championships. They handle everything from venue selection and athlete registration to logistics and marketing.

A) They provide a wide range of services for businesses and organizations.

B) They can provide decorations for your birthday party.

C) They design and build websites for businesses and organizations.

D) Hold your conference without bothering to make any arrangements.

E) Make your happiest day of your life memorable with the help of wedding planners.

F) They handle everything like booking venues and speakers for tournaments.

G) They can arrange music and food for your festival.

H) They create events that raise funds for important causes.

I) They provide legal advice and representation to individuals and businesses.

J) They book venues, sell tickets, and arrange other things ensure a successful event.

PART 3

Questions 15–20

The reading passage has six paragraphs. Choose the correct heading for each paragraph from the list of headings below. There are more headings than paragraphs, so you will not use all of them. You cannot use any heading more than once.

List of Headings:

A) Unexpected Tech Failure
B) Military Use
C) World Without Drivers
D) Health Benefits
E) Saving Time And Money
F) Other Side of the Coin
G) Robotic Future
H) Specialised Vehicles

15. Paragraph I **16. Paragraph II** **17. Paragraph III**
18. Paragraph IV **19. Paragraph V** **20. Paragraph VI**

TECH & THE FUTURE

I. Globally released worldwide, Microsoft Vista hit the markets in early 2007. Its ideology was to enhance the security system of the personal computer. But the security features weren't all that better than its previous versions', according to many software critics. Vista is also not compatible on all sorts of PC's and runs slower compared to Windows XP. All of this prevented Vista from being a better version and it never took off like the company had hoped.

II. A couple centuries ago, if you wanted to record a moment for posterity, you sat around for hours or days while someone painted it. Up until ten years ago, you were at the mercy of photo developers charging 20 cents or more to help preserve your memories. Now you can record countless images and store them electronically for all of eternity at virtually no cost per picture.

III. With technology advancing at the pace it is today, we have to believe that by the end of the century we won't be driving our cars around the city. Rather, we will just be sitting on the then historic driver's seat and doing some work. While the concept looks futuristic, industrial designer Kubik Petr believes that nothing seems impossible with modern technology at hand.

IV. The Kenguru is designed only for the disabled. Previously car manufacturers would design cars for the disabled but not specifically for them. This Hungarian company is taking it to the next step, the disabled will be able to open the rear of the car and just roll in the driving position, secure their wheelchair -- without never having to leave their chair.

V. Technology certainly offers us innumerable comforts within our world, especially when it comes to people who have extreme medical conditions and need the help of science and technology to live comfortably within their everyday lives. The creation of robot limbs allows a person to walk again. The introduction of synthetic body parts such as a heart pump can help a person to live longer.

VI. Everyone knows that being a soldier is a dangerous job. Walking through mine fields, deactivating unexploded bombs or clearing out hostile buildings, for example, are some of the riskiest tasks. What if we could send robots to do these jobs instead of humans? Then, if something went wrong, we'd only lose the money it cost to build the robot instead of losing a human life.

PART 4

Questions 21–29

Read the following text for questions 21-29.

A BRIEF HISTORY OF LONDON UNDERGROUND

It is a staple of not just the capital of the UK, but of British culture in general. It is used by more than 1.3 billion people per year, and it is more than 400 kilometres long. It has survived fires, floods, terrorist attacks and two world wars, and it has been described as a "form of mild torture", a "twopenny tube" and a system of "padded cells". It is London Underground, and it has been around for more than 150 years. But how did it all start?

The idea of an intricate train network running underneath a vibrant and heavily populated city like London might not be such a novelty in contemporary society, but it certainly was one back in the early 19th century when it was first conceived. In fact, the only reason such a notion at the time described by The Times as an "insult to common sense" was even entertained in the first place was pure desperation: during the Victorian era, London roads were insufferably overcrowded, and a Royal Commission of 1846 meant that central London was out of bounds for railway companies, whose mainline railways all had to stop just outside the City and West End.

And so the story begins, in 1863, with the opening of the Metropolitan Railway, which ran between Paddington (called Bishop's Road at the time) and Farringdon, serving a total of eight stations. Five years later, in 1868, the first section of the Metropolitan District Railway (now incorporated into the District and Circle lines) followed, running from South Kensington to Westminster. Within the first fifty years, much of what is known as Zone 1 of the London Underground system today would be built, all funded by private developers. (Unfortunately for them, none would get the financial returns they had been promised.)

People nowadays might complain about the atmosphere in London Underground, particularly in the summer, but it is nothing compared to the conditions the Metropolitan Railway's passengers had to weather during the first years of its operation. So foul was the smell in the tunnels that spread under the city that drivers were allowed to grow beards, in hopes that this would protect them from inhaling the billowing smokes. (According to the account of a civil servant from that time, the stink in the underground was comparable to that of a `crocodile's breath'.) Nevertheless, the line was a smashing success from the very beginning, with more than 11 million passengers in just the first year.

The second spate of construction works arrived with the development of electric traction at the end of the 19th century, which meant that trains no longer had to run through shallow tunnels to allow room for the steam produced by the engines to escape. Instead, new tunnels could now be dug, cutting deeper into the belly of the city. The first deep-level electric railway was opened in December 1890 by the City and South London Railway, connecting King William Street to Stockwell. In the following fifty years, the existing tube lines would systematically be extended, branching into London's various suburbs. Surprisingly, it would take until 1968 for an entirely new line to

open again: the Victoria Line (provisionally named the Viking Line), which was followed by the Jubilee Line eleven years later.

For questions 21-24, choose the correct answer A, B, C, or D.

21 What happened to the private investors who financed the early construction of the London Underground?

A) They made significant profits from their investments.
B) They were given financial support by the government.
C) They failed to earn the profits they had expected.
D) They were eventually absorbed into official government roles.

22 What was a significant issue faced by passengers and train operators during the early days of the Metropolitan Railway?

A) Train services were often delayed because of too many passengers.
B) The tunnels became unbearably hot due to lighting systems.
C) The tunnels regularly caved in while trains were running.
D) The air in the tunnels was filled with thick smoke and terrible odors.

23 What key innovation made it possible to build deeper tunnels for the London Underground?

A) The introduction of electric-powered trains
B) The creation of electric lighting systems
C) Better air circulation technology
D) The adoption of stronger building materials

24 Which of these facts accurately reflects the history of the London Underground?

A) The Jubilee Line was the first underground railway to use electric traction.
B) The Victoria Line, initially named the Viking Line, started operations in 1890.
C) Numerous brand-new lines were introduced between 1910 and 1960.
D) The City and South London Railway launched the first deep-level electric line in 1890.

For questions 25-29, decide if the following statements agree with the information given in the text.

25 More than 1.3 billion British people use London Underground annually.

A) True
B) False
C) Not Given

26 London Underground has undergone significant challenges.

A) True
B) False
C) Not Given

27 London Underground was built last century.

A) True
B) False
C) Not Given

28 Central London was not directly reachable via rail transportation.

A) True
B) False
C) Not Given

29 The Metropolitan Railway carried millions of passengers in 1863 between Paddington and Farringdon.

A) True
B) False
C) Not Given

PART 5 Questions 30–35

Read the following text for questions 30-35.

THE SUSSEX BABY LAB

Alice Skelton and fellow researchers at the Baby Lab at the University of Sussex in the UK are attempting to answer a basic question which has fascinated parents and scientists alike: when it comes to colour, what exactly can babies see? The Baby Lab study also hopes to develop ways to identify babies at risk of becoming colour blind and to discover ways to minimise the impact of this condition on their health and well-being. The technology used at the Baby Lab involves a sophisticated eye-tracking system which allows the researchers to follow the eye movements of the babies. While a camera locks its focus onto their faces, sensors register the corneal reflections in the babies' eyes and the position of the pupils in the eyes. With this data, the researchers can assess the babies' reactions to colours.

To illustrate one of their methods of studying babies, the Sussex researchers place an infant subject, four-month-old Teo Bosten-Lam, in a padded seat arranged so he gazes at a computer screen. The screen is grey, but in the top right-hand corner is a deep blue circle. When Teo shows he is aware of the circle by looking directly at it, it changes into a smiley face and a happy tune fills the room. At one point, Teo begins to look around the room. When this happens, suddenly a black and white spinning disc appears on the screen, making a 'bong' sound. A researcher explains, 'Babies can't resist the black and white swirl things.' These are played when they look away to get their attention back to the screen. And, when Teo shows he is getting tired of the whole process, the screen flashes a clip of an animated cartoon character. This results in Teo's eyes returning to the screen.

To a baby, the world changes rapidly. At birth, everything is a blur, with visual acuity around 5% of that a mature individual and faces initially only discernible at a distance of around 30 cm. But change is rapid. 'The early stages of learning to see colour and basic forms happen relatively quickly,' says Alex Wade, professor of psychology at Britain's University of York and an expert in visual processes. By the age of six months, he adds, a baby's visual acuity has developed to almost its full extent.

Just how such changes occur, and their impact on a baby's understanding of the world, is the driving force behind baby labs around the world in many different things. The Sussex Baby Lab is attempting to discover how colour is seen and understood by infants; 'It is a myth that babies see in black and white,' says Anna Franklin, head of the Baby Lab, pointing out that studies have found that newborn babies can see large, bright patches of red on a grey background. An expert on colour vision, Franklin is engaged in infancy to why certain children have colour obsessions. Her research has aided the development of infant toys, as well as children's theatre and television shows.

That we can see the world in glorious colour at all, Franklin points out, depends on specialist cells in the retinas of our eyes.

Known as cones, these come in three types — those sensitive to long, medium, and short wavelengths of light. While babies are born with all three types of cones, it takes time for these to mature, and for the brain to make sense of the signals on which a baby's discrimination of colours depends. By two months, babies can tell red and green colours apart; a few weeks later, they can also recognise blues and yellows. But the intensity of the colours is crucial. Franklin notes that if you show a baby a kind of washed-out green, they won't be able to see it, even if they can see a strong green. While a gradual improvement in a baby's ability to see faint colours occurs as they mature, it isn't known whether all colours need to be just as strong for a baby to spot them.

For questions 30-33, fill in the missing information in the numbered spaces. Write no more than ONE WORD for each question.

The Baby Lab at the University of Sussex uses eye-tracking systems to understand what **30** _____ can perceive. This equipment monitors both the reflections on the cornea and the position of the **31** _____. When babies such as Teo lose interest during testing, researchers use **32** _____ patterns to get their attention back. Though colour vision is not yet fully developed at birth, babies are born with the necessary **33** _____ in their eyes to eventually see the full range of colour.

For questions 34-35, choose the correct answer A, B, C, or D.

34 What does Anna Franklin say about the idea that babies only see in black and white?

A) It is supported by recent lab results.
B) It applies only to the first few days of life.
C) It has been proven false by research.
D) It explains why babies react to sound more than visuals.

35 What factor affects a baby's ability to detect certain colours?

A) Their exposure to outdoor light
B) The distance of an object
C) The object's shape and size
D) The strength of the colour

MOCK TEST 50

35 answers

1 animals
2 sheep
3 chicken
4 eggs
5 farmer
6 cow
7 E
8 D
9 G
10 B
11 A
12 H
13 J
14 F
15 A
16 E
17 C
18 H
19 D
20 B
21 C / They failed to earn the profits they had expected.
22 D / The air in the tunnels was filled with thick smoke and terrible odors.
23 A / The introduction of electric-powered trains
24 D / The City and South London Railway launched the first deep-level electric line in 1890.
25 Not Given
26 True
27 False
28 True
29 Not Given
30 babies
31 pupils
32 swirl
33 cones
34 C / It has been proven false by research.
35 D / The strength of the colour
