PART 1

Questions 1–6

Read the text. Fill in each gap with ONE word. You must use a word which is somewhere in the rest of the text.

IMPORTANCE OF DENTAL CARE

Regular dentist visits can do more than keep your smile attractive. They can tell dentists a lot about your overall health, including whether or not you may be at risk for disease. New research suggests that the **Q1**_____ of your mouth mirrors the condition of your body as a whole. For example, when your **Q2**_____ is healthy, chances are your overall health is good, too. On the other hand, if you have poor oral health, you may have other health problems, so it is important to see a dentist on a regular basis.

Dentists are not hard to find. If you are working, and have dental insurance coverage, your company will provide a list of **Q3** _____ care offices whose services are covered by their insurance. It would be wise to check this out. However, why is dental hygiene so important? Research shows that more than 90 percent of all systemic diseases, which involve many organs or the whole body, have oral health connections, including swollen gums, mouth ulcers, dry mouth and excessive gum problems. Diseases such as diabetes, oral cancer, heart or kidney **Q4** _____, leukemia, and pancreatic cancer can all have ties to poor oral hygiene.

Some of the things you can do starts with seeing a dentist on a regular basis. Seeing a **Q5**_____ regularly helps to keep your mouth in top shape and allows your dentist to watch for developments that may point to other health issues. A dental exam can detect problems such as poor nutrition, and improper jaw alignment. Provide your dentist with a complete medical history, and inform him or her of any recent health developments, even if they seem unrelated to your oral health. One of the great advantages of **Q6**_____ health is having a great smile. A healthy smile can give a person confidence and is a good indication of a healthy body.

PART 2

Questions 7–14

There are descriptions of companies that have job vacancies in different departments. Decide which company would be the most suitable for the following people.

7

Harvey has been working for the same bank for 10 years and does not feel appreciated. His salary has not changed for 6 years and there are no promotion prospects. He has spent the past 10 years helping new companies build their businesses and is an expert in his field.

8

Michael is the local area manager for a chain of shops in a medium sized city in the north of England. He gets a good salary but he is bored and needs a bigger challenge. He is looking for a similar job but with more responsibilities.

9

Elsa has worked for the Foreign Office for 16 years and although her work is interesting enough she is getting tired of diplomacy. She is extremely creative, speaks several languages and has excellent communication skills. She knows how to say the right things in any situation, no matter how complicated or tough.

10

Steve has done several things during his working life but has worked mostly in IT. He has been a code writer, technical support manager, network engineer, project manager, systems analyst and web page developer. He is getting a little bored of working on his own and is looking for a job where he can work with people.

11

Caroline has been working in the marketing department of a toy manufacturer for 8 years. She specializes in market research but would like to move into sales and work fewer hours than she does now. She is looking for a job that also provides childcare facilities for her 3 year-old twins.

12

Marcia's really sociable and likes spending time with other people. She also enjoys baking. In the holidays she looks after her little brother from Monday to Friday, so is only available to work at weekends.

13

Danny's going to run a marathon, so he spends his days training. However, he's free in the evenings. He enjoys being outside and doesn't want to be kept inside at work.

14

Ellie wants to work for a few hours a week. She doesn't want to work at weekends. She enjoys spending time in nature and she's happy to work on her own.

A) ASOBI This video game developer has existed for over 40 years and is recognised as a world leader in virtual reality games. Its European HQ has been in London for 15 years and has plans to expand. The company is looking for sales executives to help plan the next European sales campaign. Attractive salaries and benefits including gym, company creche, luncheon vouchers and generous holidays are on offer to candidates.

B) Monroe Financial Services This company has been around for 150 years and is highly respected. It provides financial advice and consultancy work for big business and has an impressive rate of success. An opening has become available for a financial advisor for start-up companies. The post offers a competitive salary with promotion prospects plus benefits including a company car and private health insurance to the successful candidate.

C) Dairycow Farm This food processing company has several plants in the UK and the Republic of Ireland. Its most popular product is cheese although it has gained enormous profits from its sales of yogurt. The company is looking for a production manager for a new plant in the north of Spain. The company will help look for accommodation and Spanish classes.

D) Pokey Pola This soft drinks company was founded in 1922 and has been a market leader ever since then. Sales of its soft drinks continue to go up but it would like to expand into the energy drink market. It needs a marketing manager with a good track record to do this. Long hours are required but the salary more than compensates for that.

E) Suncom is the most successful IT 14 solution provider in Ireland and is opening an office in London to deal with its growing client base. The company is looking for a training manager to work in the human resources department. The successful candidate will be responsible for designing and running training courses for new employees just starting with the company.

F) The Idea Shop The leading public relations company in the world is, without doubt, The Idea Shop. This company was founded in 1961 and has advised governments and big business on how to communicate with the public and media on important issues. A well-paid post for client account manager is on offer. An ability to communicate well and give imaginative solutions to complex problems is vital in this role.

G) Kokina Kokina is a leading name in the cell phone industry. Its products will sell around the world even if they are a little out-dated. These mobile phones are perceived as durable and virtually indestructible. The trouble is, modernising has been very difficult. The company is looking for a strategy manager to plan and oversee modernisation.

H) Markdown The leading low-cost clothing retailer in the UK has only been around for about 5 years but is dominating the market. Almost every high street in the country has an outlet of Markdown and the company employs more than 10,000 workers. A regional manager is needed for the south west of the country to oversee operations and maintain its position as the number one retail outlet for the area.

I) Kitchen assistant required we need a part-time assistant to work in the small kitchen of our hotel restaurant. The job involves preparing food before the restaurant opens and then cleaning the dishes after they have served the food. We require someone to work three hours Tuesday to Saturday, and Friday and Saturday evenings. We offer good pay.

J) Dog sitter needed we'd like to employ a local dog sitter to look after our two dogs for one hour a day Monday to Friday. We'd like you to take the dogs for a walk through the woods and then feed them when they return home. We're looking for a responsible, independent person.

K) Care home assistant wanted A young person is wanted to work at our care home for four hours on Saturday and Sunday afternoons. The job requires you to make tea and fetch snacks for our elderly residents, as well as sit and chat to them. All our assistants must have basic kitchen skills.

L) Furniture delivery person wanted Do you want to keep fit? Do you enjoy varied work? Are you willing to work many hours a week? If so, then apply for the job of delivery person at our furniture shop. We deliver large pieces of furniture to customers, so you'll need to be physically strong and happy to travel out of the area.

M) Weekly delivery person needed We're looking for a fit, healthy person to deliver our weekly newspaper to over 100 homes in the Dilton area. You must be able to walk or cycle over three miles while pulling a shopping trolley full of newspapers in all kinds of weather. The job takes around three hours per week. We're happy for you to do it after 6 pm.

PART 3

Questions 15–20

Read the text and choose the correct heading for each paragraph from the list of headings below. There are more headings than paragraphs, so you will not use all of them. You cannot use any heading more than once.

List of Headings:

A) Potential production capabilities of vertical farms
B) Opposition to new ideas about food production
C) A successful application of vertical farming technology
D) The potential to provide urgent relief
E) The original inspiration for vertical farming
F) Various environmental benefits of vertical farming
G) An increasing problem for farmers worldwide
H) A return to traditional farming methods
I) A rising demand for food

15. Paragraph I **16. Paragraph II** **17. Paragraph III**
18. Paragraph IV **19. Paragraph V** **20. Paragraph VI**

SKYSCRAPER FARMING

I. Today's environment scientists are in no doubt that the world's resources of fertile soil are rapidly deteriorating, and that new land for agriculture is becoming ever more sparse. Intensive farming, urbanisation, desertification and sea-level rises are all putting growing pressure on the planet's agricultural land and therefore on food supplies. Currently 24 per cent of the world's 11.5 billion hectares of cultivated land has already undergone human-induced soil degradation particularly through

erosion, according to a recent study by the UK Government Office for Science.

II. The global population is expected to exceed nine billion by 2050 — up a third from today's level and studies suggest that food production will have to go up by 70 per cent if we are to feed all of those new mouths. This means that scientists will have to develop new ways of growing crops if we are to avoid a humanitarian crisis. Indeed, UN Food and Agriculture Organization figures suggest that the number of undernourished people is already growing. And with escalating climate change, crop yields in many areas have been projected to decline.

III. With this in mind, some scientists and agricultural experts are advocating an innovative alternative to traditional farming whereby skyscrapers packed with shelf-based systems for growing vegetables on each storey, known as 'vertical farms', could hold the key to revolutionising agriculture. Columbia University professor Dickson Despommier claims that vertical farming could boost crop yields many times over. A single 20-storey vertical farm could theoretically feed 50,000 people, according to Despommier. And if the theory translates into reality as proposed, 160 skyscraper-sized vertical farms could feed the entire population of New York City, while 180 would be needed to feed London, 289 to feed Cairo and 302 to feed Kolkata.

IV. It's a compelling vision, and one that has already been put into practice in Asia. Albeit on a smaller scale. But there are problems, such as initial investment and operating costs that are too great' says a spokesman for Japan's Ministry of Agriculture, Forestry and Fisheries. Nevertheless Tokyo-based mushroom producer Hokuto Corporation is a model example of how a vertical farm can be profitable. With 28 vertical mushroom farms operating across the country, it produces some 68,000 tonnes of mushrooms annually. 'Vertical mushroom farms have many advantages over ground-level farms,' says Hokuto's Ted Yamanoke. Yamanoke goes on to highlight the relative cost-effectiveness of his organisation's farming practices together with reduced emissions of greenhouse gases.

V. And the impact of vertical farms could extend beyond firmly established urban populations. Despommier sees them as being capable of helping centres of dispossessed persons — such as refugee camps — in much the same way that Mobile Army Surgical Hospital (MASH) units are deployed in emergency situations. 'Developing an emergency response system for crop production inside specially constructed modular and highly transportable greenhouses would allow for humanitarian interventions, at least for refugees that are forced out of their countries by political turmoil,' he says. 'If you have three or four storeys of food already growing some place, they could become mobile units that could be picked up by helicopters and dropped into the middle of a crisis zone. The food would be ready to pick and eat. It could be designed to supply people with all the nutrition they need to make it through the crisis.'

VI. But it isn't only about increasing food production. Despommier is concerned about the harm which farming has done to the world's landscape over a relatively short time span, particularly the elimination of hardwood forests. 'Farming is only 12,000 years old,' he points out. 'Vertical farming could for the first time allow us to feed everyone on earth and still return land to its original ecological function.' Natalie Jeremijenko, associate professor at New York University, agrees. 'The challenge that we have now is how we can design urban agriculture systems that not only reduce food miles, but also improve the world's ecosystems,' she says. By significantly reducing the amount of land required for food production, vertical farms could help to enrich biodiversity. And according to Jeremijenko, this can, in turn, help to improve the productivity of conventional farms, as the health of agricultural land is often tied to the health of the surrounding ecosystems. Furthermore, vertical farming could dramatically cut the utilisation of fossil fuels. And also reduce geopolitical tensions in countries where poor farming conditions cause conflict and malnutrition.

PART 4

Questions 21–29

Read the following text for questions 21-29.

THE FLUORIDATION CONTROVERSY

The long-standing debate about whether to fluoridate our drinking water continues. Fluoridation is the addition of fluoride to public water supplies with the aim of reducing tooth decay. The fluorine, when mixed with water, becomes fluoride and the desired concentration of fluoride in public water is approximately one part per million, depending on the regional temperature and hence the amount of water people are likely to drink. Many studies, such as those by McClure in 1970 through to Burt in 1983, have shown that when children drink fluoridated water, their average rate of tooth decay seems reduced. A typical figure claimed is 50 percent reduction. This apparently enormous benefit for children's teeth is the major argument in favor of fluoridation.

Three main grounds for opposition to fluoridation have been expressed. First, opponents claim the benefits are exaggerated or not established. Second, there are claims of health risks to part of the population, for example, allergic reactions. It is also accepted that high levels of fluoride can cause discoloration of otherwise healthy teeth. Proponents do not consider this to be a problem in such small concentrations, whereas opponents disagree — especially because some people drink more water and obtain much more than the standard 1 milligram of fluoride per day. Third, fluoridation is thought to be an infringement on individual rights because it is compulsory medication of all members of a community.

An understanding of the fluoridation issue has important implications. If, according to the experts, fluoridation is unquestionably a beneficial and non-hazardous measure, then the wisdom of allowing the public to vote on, and reject it must be questioned.

Almost all studies that have been done have assumed that the scientific aspects of the controversy are unproblematic, and they have excluded science from sociological examination. The traditional view is that science is a special kind of knowledge, which is established through scientific methods and successively applied by members of a scientific community. However, in recent years there has been a major challenge to this picture by a sociology of science that views how scientific knowledge is socially negotiated, and inevitably linked to the values of the relevant parties, both internalist and externalist. These challenges do not see scientific knowledge as exempt from social inquiry.

Kuhn (1970) argued that scientific knowledge does not always develop as an orderly process, but is characterised by periodic revolutions, in which the methods of study and the assessment criteria change in a fragmented way. According to Kuhn, the shift from one scientific way of thinking to another is not made solely on the basis of clear rules of formal scientific practice, but can include social factors, though Kuhn has never developed a full analysis of what these might be. Collins (1975) took this concept further when he asserted that the outcome of experiments was not something whose meaning could be immediately comprehended, but rather something foregone conclusion between scientists, and reinterpretation in the light of online experiments.

One interpretation of this analysis of science is that traditional distinctions between facts and theories, and between scientific knowledge and values, can no longer be justified. Because social processes are involved in all stages of the creation, evaluation, and establishing of scientific knowledge, social values may also be involved.

In the same way as many scientists who study fluoridation have overlooked social values, sociologists have also downplayed an important part of the debate by ignoring the studies of eminent scientists who have questioned aspects of fluoridation. An example is the study by Sutton in 1960, which analyzed the classic North American studies of the effect of fluoridation on tooth decay, and found that each showed significant methodological shortcomings. Sutton's detailed study throws doubt as to the extent of reductions in tooth decay from fluoridation. Yet Sutton's book is not cited in a single analysis of the fluoridation issue by any sociologist. In a situation of some scientific uncertainty, differences in values are highlighted. A supporter of fluoridation might argue, 'The evidence for the benefits of fluoridation is quite substantial, while the evidence for harm is limited and dubious. I think the likely benefits outweigh the possible dangers; hence I support fluoridation because it is the cheapest and easiest way to make sure every child reaps the benefits.' An opponent might argue, 'Though the evidence for the benefits of fluoridation is substantial, there is some doubt about it. Since fluoridation is not necessary for good teeth, we should forego the benefits if there is some slight chance of harm. Some scientists claim that a small percentage of the population could be harmed by fluoride. Therefore I oppose fluoridation of water supplies and favor the voluntary use of fluoride tablets by those who want to take them.'

Both arguments consider the scientific evidence concerning fluoridation, but differ in their assessments of the social benefits and costs. This difference is not between rationality and irrationality but is a legitimate difference in values, for example, the positive value placed on good teeth, the negative value placed on possible health risks, and the social benefits or costs of compulsory or voluntary intake of fluorides.

From the sociological point of view, opposition to fluoridation is not necessarily irrational. Rather, claims to rationality and to scientific authority are better seen as part of a strategy to promote fluoridation than as incontrovertible statements of fact. Second, social values are likely to be bound up in any decision about fluoridation, so this is not an issue on which declarations by scientific experts ought to be considered the final word.

For questions 21-25, choose the correct answer A, B, C, or D.

21 **The optimum amount of fluorine in fluoridated water is calculated partly according to**

A) how hot the area is.
B) how warm the water is.
C) how many dental problems there are in the community.
D) how much fluorine the community chooses to have in its water.

22 **One reason given by the writer for opposing fluoridation is that**

A) it may contribute to tooth decay.
B) it will be unacceptably expensive for the public.
C) obligatory fluoridation takes away personal freedom.
D) excessive fluoride could be added to the water by mistake.

23 **The writer mentions Kuhn in order to**

A) provide a contrast with the view of Collins.
B) support the rational nature of scientific inquiry.
C) demonstrate that Kuhn did not argue his case adequately.
D) show that science can be influenced by non-scientific considerations.

24 **What did Sutton's research discover about earlier studies in North America?**

A) There were failings in the way they were carried out.
B) The scientists involved had achieved unique results.
C) Proponents of fluoridation had not understood its long-term effects.
D) Fluoridation had a greater effect on tooth decay than previously believed.

25 **In the last paragraph, what does the writer say about scientists?**

A) They should reveal their true motivations.
B) They should not decide the fluoridation policy.
C) They are solely concerned with scientific truths.
D) They cannot reach agreement on the fluoridation issue.

For questions 26-29, decide if the following statements agree with the views of the writer.

26 **Scientific knowledge should be kept separate from social values.**

A) True
B) False
C) Not Given

27 **Many sociologists have disregarded the doubts that some scientists have concerning fluoridation.**

A) True
B) False
C) Not Given

28 **Sutton's findings have been given insufficient attention by scientists outside of North America.**

A) True
B) False
C) Not Given

29 **There are valid arguments on both sides of the fluoridation debate.**

A) True
B) False
C) Not Given

Read the following text for questions 30-35.

ECONOMIC EVOLUTION

Sitting along the Orinoco River that borders Brazil and Venezuela are the Yanomami people, hunter-gatherers whose average annual income has been estimated at the equivalent of $90 per person per year. Living along the Hudson River that borders New York State and New Jersey are the Manhattan people, consumer-traders whose average annual income has been estimated at $36,000 per person per year. That dramatic difference of 400 times, however, pales in comparison to the differences in Stock Keeping Units (SKUs, a measure of the number of types of retail products available), which has been estimated at 300 for the Yanomami and 10 billion for the Manhattanites, a difference of 33 million.

How did this happen? According to economist Eric D. Beinhocker, who published these calculations in his revelatory work The Origin of Wealth (Harvard Business School Press, 2006), the explanation is to be found in complexity theory. Evolution and economics are not just analogous to each other, says Beinhocker, but they are actually two forms of a larger phenomenon called complex adaptive systems, in which individual elements, parts, or agents interact, then process information and adapt their behaviour to changing conditions. Immune systems, ecosystems, language, the law and the Internet are all examples of complex adaptive systems.

In biological evolution, nature selects from the variation produced by random genetic mutations and the mixing of parental genes. Out of that process of cumulative selection emerges complexity and diversity. In economic evolution, our material economy proceeds through the production and selection of numerous permutations of countless products. Those 10 billion products in the Manhattan village represent only one percent of the possible types of products that are theoretically possible according to Beinhocker's calculations. As complex as our economy appears to be, it represents only the very tip of the iceberg of complexity that is possible. Most of these products evolved in the marketplace for those deemed most useful, with the best technology winning, others becoming relics found only in museums and remanufacturing.

The correspondence between evolution and economics is not perfect, because some top-down institutional rules and laws are needed to provide a structure within which free and fair trade can occur. But too much top-down interference into the marketplace makes trade neither free nor fair. When such attempts have been made in the past, they have failed — because markets are far too complex, interactive and autocatalytic to be designed from the top down. In his 1922 book, Socialism, Ludwig Von Mises spelt out the reasons why most notably the problem of 'economic calculation' in a planned socialist economy. In capitalism, prices are in constant and rapid flux and are determined from below by individuals freely exchanging in the marketplace. Money is a means of exchange, and prices are the information people use to guide their choices. Von Mises demonstrated that socialist economies depend on capitalist economies to determine what prices should be assigned to goods and services. And they do so cumbersomely and inefficiently. Relatively free markets are, ultimately, the only way to find out what buyers are willing to pay and what sellers are willing to accept.

Economics helps to explain how Yanomami-like hunter-gatherers evolved into Manhattan-like consumer traders. In the Nineteenth century French economist Frédéric Bastiat well captured the principle. 'Where goods do not cross frontiers, armies will.' In addition to being fierce warriors, the Yanomami are also sophisticated traders, and the more they trade the less they fight. The reason is that trade is a powerful social adhesive that creates political alliances. One village cannot go to another village and announce that they are worried about being conquered by a third, more powerful village — that would reveal weakness. Instead, they mask the real motives for alliance through trade and reciprocal feasting. And, as a result, not only gain military protection but also initiate a system of trade that — in the long run — leads to an increase in both wealth and SKUs.

Free and fair trade occurs in societies where most individuals interact in ways that provide mutual benefit. The necessary rules were not generated by wise men in a sacred temple or lawmakers in congress, but rather evolved over generations and were widely accepted and practised before the law was ever written. Laws that fail this test are ignored. If enforcement becomes too onerous, there is rebellion. Yet the concept that human interaction must, and can, be controlled by a higher force is universal. Interestingly, there is no widespread agreement on who the 'higher force' is. Religious people ascribe good behaviour to God's law. They cannot conceive of an orderly society of atheists. Secular people credit the government. They consider anarchy to be synonymous with barbarity. Everyone seems to agree on the concept that an orderly society requires an omnipotent force. Yet, everywhere there is evidence that this is not so. An important distinction between spontaneous social order and social anarchy is that the former is developed by work and investment, under the rule of law and with a set of evolved morals while the latter is chaos. The classical liberal tradition of von Mises and Hayek never makes the claim that the complete absence of top-down rules leads to the optimal social order. It simply says we should be sceptical about our ability to manage them in the name of social justice, equality, or progress.

For question 30, choose the correct answer A, B, C, or D.

30 What ought to play a vital role in each field of the economy?

A) a strict rule
B) a smart strategy
C) a tightly managed authority
D) a powerful legislation

Complete the following summary of the paragraphs of Reading Passage, using no more than THREE words from the Reading Passage for each answer.

In response to the search for reasons for the phenomenon shown by the huge difference in the income between two groups of people both dwelling near the rivers, several researchers made their effort and gave certain explanations. One attributes **31** _____ to the interesting change claiming that it is not as simple as it seems to be in appearance that the relationship between **32** _____ which is a good example of **33** _____, which involved in the interaction of separate factors for the processing of information as well as the behavioural adaptation to unstable conditions. As far as the biological transformation is concerned, both **34** _____ and the blend of genres from the last generation brings about the difference. The economic counterpart shows how generating and choosing the **35** _____ of innumerable goods moves forward the material-oriented economy.

MOCK TEST 51

35 answers

1 health
2 mouth
3 dental
4 disease
5 dentist
6 oral
7 B
8 H
9 F
10 E
11 A
12 K
13 M
14 J
15 G
16 I
17 A
18 C
19 D
20 F
21 A / how hot the area is.
22 C / obligatory fluoridation takes away personal freedom.
23 C / demonstrate that Kuhn did not argue his case adequately.
24 A / There were failings in the way they were carried out.
25 B / They should not decide the fluoridation policy.
26 False
27 True
28 Not Given
29 True
30 C / a tightly managed authority
31 complexity
32 evolution and economics
33 complex adaptive systems
34 random genetic mutations
35 permutations
